Secure Identities and Access Deployment

Protect your user identities and keep your oganisation safe

Identity is today's control plane for digital transformation. Organisational barriers are blurring between who is in and out of your network. Cloud apps and the increasing use of personal devices and remote work mean that data is no longer centralised behind traditional network security.

With identity attacks on the rise, this workshop will show you how to stop tomorrow's data breaches by securing identities today. We will help you find identity risks happening now in your environment, gain insights on your application landscape, and improve your identity security posture.

By attending this workshop, our experts will work with you to:

Identify potential risks related to identity and see opportunities for improvement.

Receive a numerical rating of your identity security posture and see how it compares to similar organisations.

Minimise expenses associated with password reset and helpdesk resources.

Get a sample survey of apps your employees are using and if IT supports them or not.

By the end of this 5 day workshop you will have gained

Understanding of your identity goals and objectives as well as defined your existing and desired identity security posture.

Learn how to reduce costs and improve business agility and security with simplified app access for your users.

Insights into applications used within your environment (sanctioned and unsanctioned by IT) and understand how to prevent identities from being compromised.

Recommended activities and next steps to protect your authorised users' identities so you can authenticate credentials and manage file access while still giving users the freedom to collaborate with others.
